Import options for chemical energy carriers from renewable sources to Germany

EU energy supply dominated by imports

- Majority of EU energy import from outside
- Fossil chemical energy carriers (gas, oil, coal)
- Domestic renewable potentials limited
- Import situation unlikely to change soon

Energy Import Dependency: Share in % of energy imports from outside EU relative to total energy demand in 2019

Need sustainable & ready solution:

- Sustainable energy sources (wind, PV)
- Closed cycle for feedstock streams (CO₂)
- Use existing technologies
- Quick deployment and scale-up
- Known chemical energy carriers

Abstract

Import and export of fossil energy carriers are cornerstones of energy systems world-wide. If energy systems are to become climate neutral and sustainable, fossil carriers need to be substituted with carbon neutral alternatives or electrified if possible. We investigate synthetic chemical energy carriers, hydrogen, methane, methanol, ammonia and Fischer-Tropsch fuels, produced using electricity from Renewable Energy Source (RES) as fossil substitutes. RES potentials are obtained from GIS-analysis and hourly resolved time-series are derived using reanalysis weather data. We model the sourcing of feedstock chemicals, synthesis and transport along nine different Energy Supply Chains to Germany and compare import options for seven locations around the world against each other and with domestically sourced alternatives on the basis of their respective cost per unit of hydrogen and energy delivered. We find that for each type of chemical energy carrier an import option with lower costs compared to domestic production in Germany exists. The lowest cost import options for energy and hydrogen are by hydrogen pipeline from Denmark, Spain and Western Asia and Northern Africa at 40.6 EUR/MWh_{LHV} to 46.8 EUR/MWh_{LHV} (1.4 EUR/kg_{H2} to 1.6 EUR/kg_{H2}) in 2050 assuming 5% p.a. capital cost. For complex energy carriers like methane, ammonia, methanol or Fischer-Tropsch fuels, imports from Argentina by ship to Germany are attractive even compared to closer European Union or Western Asia and Northern Africa exporters. For meeting hydrogen demand, direct hydrogen imports are more attractive than indirect routes using methane, methanol or ammonia imports and subsequent decomposition to hydrogen because of high capital investment costs and energetic losses of the indirect routes. We make our model and data available under open licenses for adaptation and reuse.

PyPSA: Python for Power System Analysis

PyPSA: Python for Power System Analysis

PyPSA stands for "Python for Power System Analysis". It is pronounced "pipes-ah".

PyPSA is an open source toolbox for simulating and optimising modern power systems that include features such as conventional generators with unit commitment, variable wind and solar generation, storage units, coupling to other energy sectors, and mixed alternating and direct current networks. PyPSA is designed to scale well with large networks and long time series.

Cost compositions

Comparison today's fossil alternatives

	Cheapest renewable alternatives (2050, 5% WACC)	Fossil market prices (2020)
Ammonia (EUR/t)	368	130-290
Methanol (EUR/t)	465	150-400
Methane (EUR/MWh)	58.5	31.50
FT fuels (EUR/kL)	1476	584

- (favourable) costs > market prices
- Comparable orders of magnitude
- Policy / voluntary actions necessary
- Comparability issue: Costs != prices

Conclusion

- We need chemical energy carriers
- Import is an attractive option for Germany
- H2 imports by pipeline are cheapest option
- RES-based chemicals not cost-competitive
with today's market prices
